Hands-on Activity 8.1: Aggregating Data with Pandas 8.1.1 Intended Learning Outcomes After this activity, the student should be able to:

demonstrate querying and merging of dataframes

Perform advanced calculations on dataframes

Aggregate dataframes with pandas and numpy

Work with time series data

- 8.1.2 Resources Computing Environment using Python 3.x Attached Datasets (under Instructional Materials) 8.1.3 Procedures The procedures can be found in the canvas module. Check the following under topics:
- 8.1 Weather Data Collection Githublink for 8.1 8.2 Querying and Merging Githublink for 8.2 8.3 Dataframe Operations Githublink for 8.3 8.4 Aggregations Githublink for 8.4 8.5 Time Series Githublink for 8.5 8.1.4 Data Analysis Provide some comments here about the results of the procedures.

Storing Data in SQLite: I learned how to store a Pandas DataFrame in an SQLite database. It felt really empowering because now I know how to save data in a way that's easy to retrieve and manage later.

Data Manipulation Language (DML): I practiced using DML to update and organize data within the database. It was a little tricky at first, but I got the hang of it. It's definitely going to help when I need to adjust or clean up data for analysis.

Aggregating Data: I learned was how to use Pandas' aggregate functions to calculate things like the mean, minimum, and maximum values all at once.

Grouping Data: I also got to work with the groupby function, which groups data by a category and lets me apply different calculations to each group. For example, if I have weather data from different stations, I can group the data by station and easily get the average temperature or total rainfall.

Handling Time-Based Data: The real challenge came when I had to work with data that included dates and times (not just dates). I used functions like between_time and at_time to pull out data for specific hours or time ranges. This was a big step up because it let me work with hourly weather data instead of just daily data.

Storing, Manipulating, and Analyzing Data: Overall, I feel so much more confident in my ability to store, manipulate, and analyze data now. Learning how to work with time-based data, in particular, has been a game-changer.

Challenges with Newer Pandas Versions: But, of course, it wasn't all smooth sailing. Some of the code I was using before didn't work with the latest version of Pandas. I got a warning about deprecated functions like last() and first(), which meant I had to figure out how to replace those with newer methods. It was a bit frustrating, but I eventually found the alternatives and it was a good reminder to stay updated with library changes!

8.1.5 Supplementary Activity Using the CSV files provided and what we have learned so far in this module complete the following exercises:

With the earthquakes.csv file, select all the earthquakes in Japan with a magType of mb and a magnitude of 4.9 or greater. Create bins for each full number of magnitude (for example, the first bin is 0-1, the second is 1-2, and so on) with a magType of ml and count how many are in each bin. Using the faang.csv file, group by the ticker and resample to monthly frequency. Make the following aggregations: Mean of the opening price Maximum of the high price Minimum of the low price Mean of the closing price Sum of the volume traded Build a crosstab with the earthquake data between the tsunami column and the magType column. Rather than showing the frequency count, show the maximum magnitude that was observed for each combination. Put the magType along the columns.

Calculate the rolling 60-day aggregations of OHLC data by ticker for the FAANG data. Use the same aggregations as exercise no. 3.

Create a pivot table of the FAANG data that compares the stocks. Put the ticker in the rows and show the averages of the OHLC and volume traded data.

Calculate the Z-scores for each numeric column of Netflix's data (ticker is NFLX) using apply().

Add event descriptions: Create a dataframe with the following three columns: ticker, date, and event. The columns should have the following values: ticker: 'FB' date: ['2018-07-25', '2018-03-19', '2018-03-20'] event: ['Disappointing user growth announced after close.', 'Cambridge Analytica story', 'FTC investigation'] Set the index to ['date', 'ticker'] Merge this data with the FAANG data using an outer join

Use the transform() method on the FAANG data to represent all the values in terms of the first date in the data. To do so, divide all the values for each ticker by the value

```
import pandas as pd
earthquake = pd.read_csv('earthquakes.csv')
faang = pd.read_csv('faang.csv')
earthquake.head(5)
```

```
